NEWS RELEASE

Putting power behind our commitment to sustainability

2023-10-02

Ferguson announced a 65-megawatt (MW) Virtual Power Purchase Agreement (VPPA) with ENGIE's Century Oak wind project in Callahan County, Texas.

The partnership with ENGIE North America, a global leader in low-carbon energy and services, is set to generate a substantial amount of clean wind power and is expected to offset a significant portion of Ferguson's annual electricity consumption across the U.S. and Canada.

Ferguson is committed to reducing its operational carbon emissions by 35% by FY2026. To achieve this ambitious target, Ferguson is focusing on three key areas:

Fleet: Optimizing delivery routes and transitioning to electric trucks where appropriate.
Facilities: Continuing to retrofit facilities with LED lighting and energy-efficient HVAC systems.
Renewable energy: Boosting renewable energy consumption through both onsite and offsite solutions.
"This project is a major milestone in helping Ferguson address our operational emissions and assist in decarbonizing the grid. Sourcing renewable energy at scale is where we can have the greatest impact on our operational emissions. Investing in an offsite wind farm minimizes business disruption and allows us to take

advantage of Ferguson's scale and purchasing power. Our goal is to reduce our environmental footprint, and pursuing offsite renewable energy opportunities like this one benefits our planet, our business and the Callahan County community," explained Michael Wong, Senior Manager of Environmental Sustainability at Ferguson.
